Problem number #25

Opponence from Team Romania

Overall summary

- The presentation has a good structure, and it was clear to follow.
- The glass could have bended.

Theoretical Part

Positive characteristics	Negative characteristics
Rigorous material was presented, although some more text could have helped.	Some of the photos had results in an unknown language which didn't allow me to understand some of the things.
	No mention of the superficial forces which are a big part of the experiment.
	The formulas used were valid for cylinders not cone bodies.

Experimental Part

Positive characteristics	Negative characteristics
The experiment was done in a properly controlled manner.	Temperature was not measured, and it is an important factor.
The experiment reached clear results.	You considered the glass a cillinder and tus the formulas were wrong
Supplies used were rudimentary allowing for repeatability.	More quantitative data could have been used.
	Did not mention the time before paper breaks.

Discussion

Thank you
