Clarifying Questions

- Did you only use your hands to stir?
- What rocks did you use exactly?
- Can you refer back to your findings?

Positives

1. Conducted multiple experiments
2. Clear layout of presentation

Negatives

1. Reporter had an unclear conclusion
2. Lacking a lot of areas in theory
3. Experiment was irrelevant to the topic
4. Confusing/ unexplained pictures of theory

Discussion

- Other indirect parameter could have been tested such as heat
- Using only hands to stir would not give a constant/reliable result due to human error
- Using the materials used would make the water a solution, which then has different properties which don't relate to the topic

Conclusion

- The reporter had multiple variables in which he changed in his experiment, while conducting a clear presentation
- However the reporter lacked to meet the topic problem by changing the water to a solution of different solutes
- Lacking to meet the problem then led to an unclear conclusion

Thank You
