

9. Parosmia: Opposition

Opponent: Lora Serafimova

Team Bulgaria B 

9. Parosmia

Misperception of existing odors is a **common post-COVID** side effect that may **persist for months**. Collect data to study and characterize this dysfunction.

Theory

- Explained how parosmia is formed briefly
- Explained how Covid affects us

- Didn't explain well enough how parosmia happens
- The treatment was unimportant
- Did not show an own hypothesis for the effect

Experiment

- Clear visualisation
- Created own survey

- Most of the data is not from the presenter, but rather from research of other people.
- No explanation where and how was the research data collected

Results

- Different charts
- Good and clear visualization

- Not considering the different variants of COVID-19
- Didn't explain how the effect happens

Questions for Discussion

1. Why and how do you think parosmia and anosmia are related?
2. Do you think parosmia could affect taste buds? How?
3. Why do you think these specific foods trigger parosmia?
4. Do you think specific COVID variants cause parosmia?

Thank You!
